

# NOVA RESIN COATED PAPER DRYER

## SETTING UP

Ensure that the unit is fitted with a 3 pin 13Amp plug before proceeding. If not, then please contact your supplier.

Position the dryer away from wet areas of your room. It is also very important that the rear air intake is not obstructed or pushed up against a wall (always allow at least 4" (10cm) gap) otherwise overheating will occur and result in the equipment being damaged.

Slide the four white shelves into their respective channels inside the dryer.

## IN USE

The switch nearest to the power cable is the heat setting selection switch and the other is the mains on/off switch. A red light will glow when the power is switched on.

There are three possible heat settings on your dryer - cold, warm and hot; these are selected by way of the positioning of the 3 way heat selection switch.

COLD - Heat selection switch in central position.

WARM - Heat selection switch with top pressed in.

HOT - Heat selection switch with bottom pressed in.

i) Switch the unit onto a warm setting for 3 minutes for initial 'warming up'.

ii) Take your resin coated print, which must be fully 'squeegeed' - all excess water removed - before placing emulsion side up onto one of the shelves.

iii) Use either a warm or hot setting for approximately 2 - 3 minutes when the print should be almost dry. You will notice that the paper will curl slightly at the edges. Using the cold blow only at this point, for about a minute or so, will encourage the paper to flatten out.

iv) Continue this procedure throughout your whole printing session. If drying many prints, then a print rotation technique will ensure that there will always be spaces for freshly washed prints.

v) Never leave prints in the dryer under excessive heat for more than 5 minutes otherwise damage to the sensitive emulsion may occur.

Should you experience any problems whilst using or setting up this equipment, please do not hesitate to contact us on the numbers below.
